

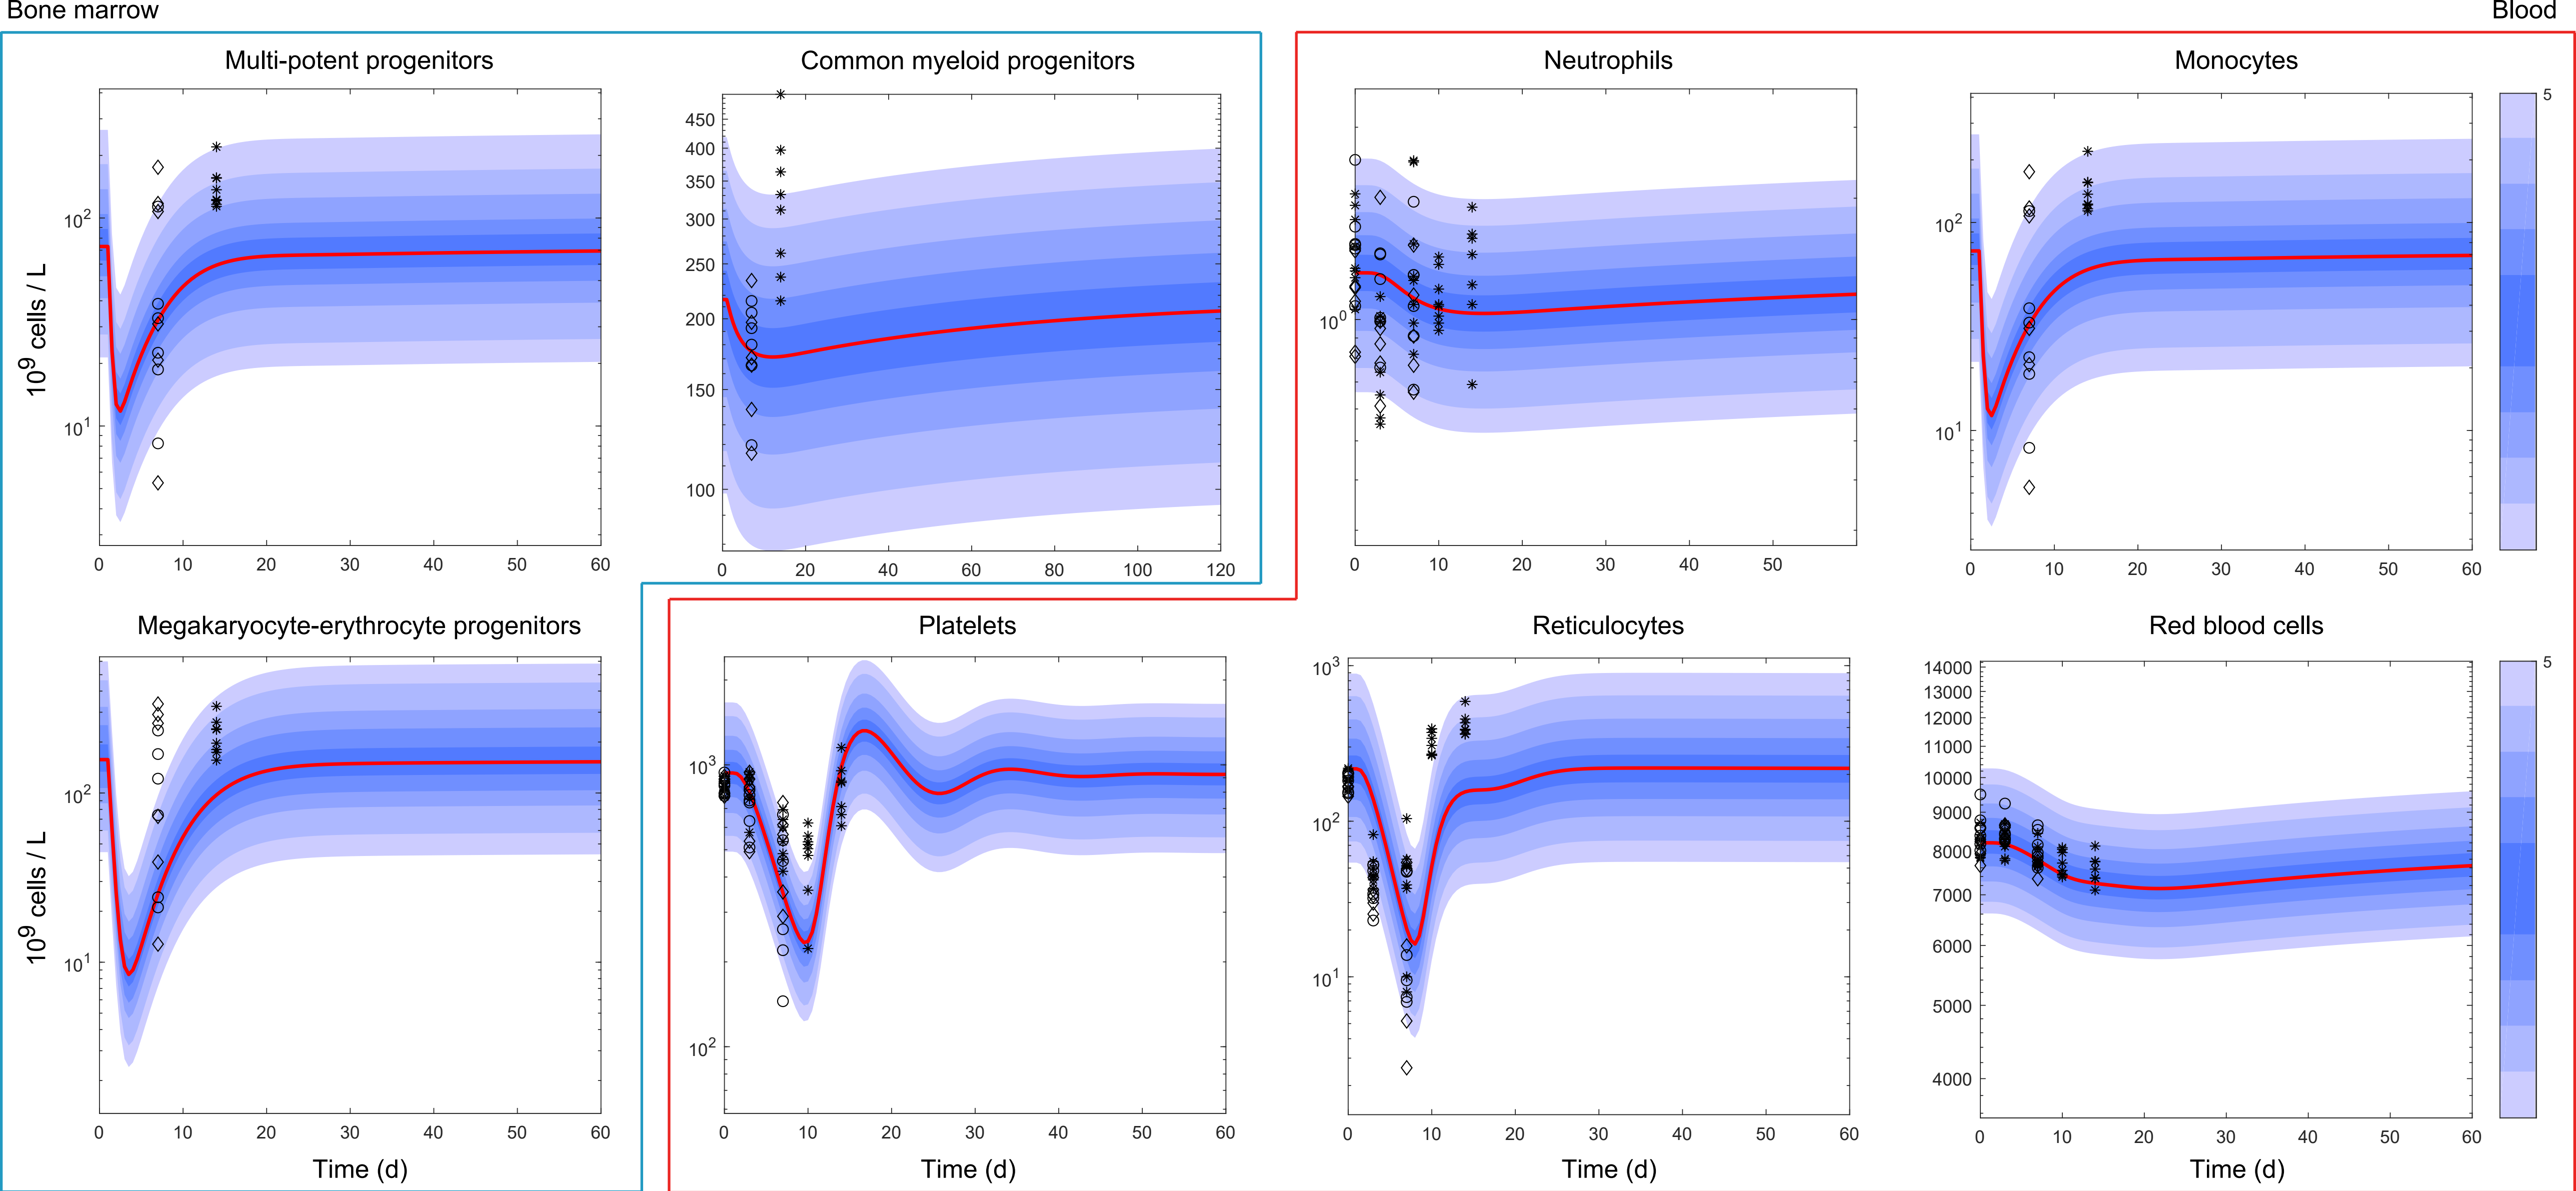

Figure S1 Overall myelosuppression profile induced by one cycle of carboplatin 30 mg/Kg. Rats were dosed with carboplatin 30 mg/Kg on day 1 (Table S1). Plots show the time-course of carboplatin effects across the main bone marrow progenitor populations (MPP, CMP, MEP), and mature blood cells (neutrophils, monocytes, platelets, reticulocytes, red blood cells). All populations, but neutrophils and monocytes, recover to baseline values. Symbols show the observations, red lines show average model predictions, while blue shadow areas show percentiles in simulated data. Visual predictive checks were generated from 1000 simulations, using the log-additive residual errors reported in Table S4.
