

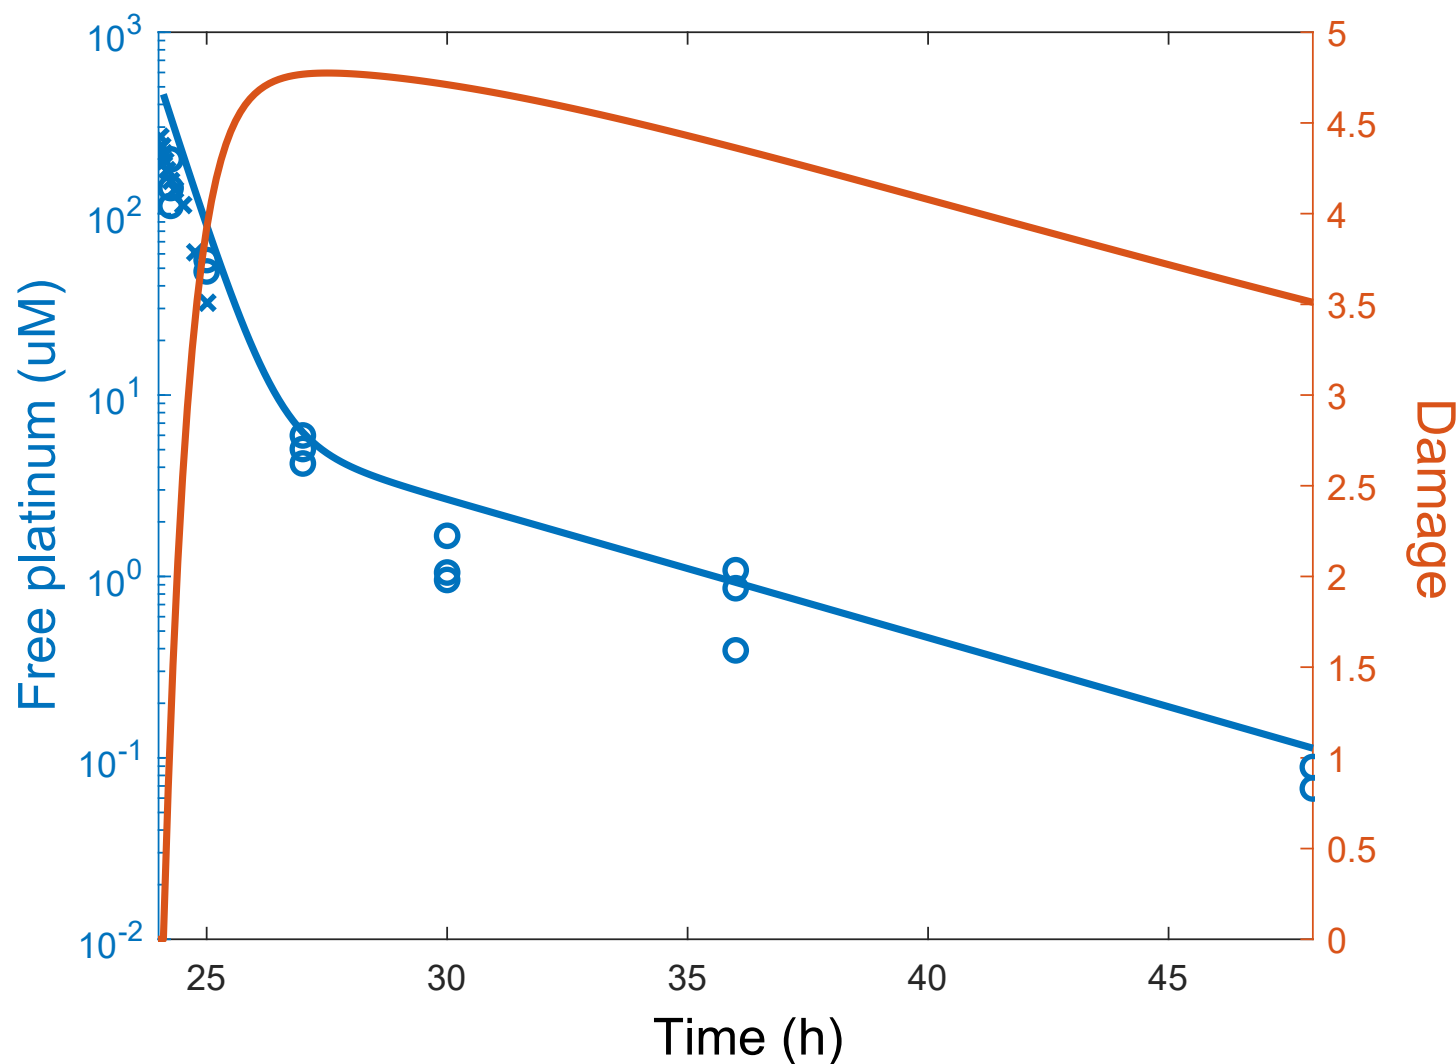

Figure S3 Free platinum pharmacokinetics in rat and damage response. After systemic administration of carboplatin 20 mg/kg (“x” points, Siddik et al., 1) or 30 mg/kg (“o” points, in-house data), free platinum concentration is cleared from the plasma in about 24 hours. The blue line shows the fit of the PK model reported in Equation S1 to these free platinum PK rat data (“x” and “o”), supplementary text S5. Parameter estimates are reported in Table S3. The orange line shows the amount of DNA damage induced by carboplatin predicted by the model, Equation 3 (main text).
