

Figure S7. Bifurcation plots and model oscillations. Panel A Bifurcation diagram for platelets (green) and reticulocytes (red), showing how the system oscillates after going through Hopf bifurcation points (HB1, HB2) for increasing values of $\gamma_{\text{prolTrans}}$ parameter. Solid lines represent stable steady states, dashed lines represent unstable steady states. Parabolic curves departing from the horizontal lines represent maximum and minimum excursions of platelets (blue and light blue) and of reticulocytes (brown and orange) during oscillations. Panel B Sustained platelet (green) and reticulocyte (red) oscillations, obtained with $\gamma_{\text{prolTrans}}=6$ and $\gamma_{\text{prolTrans}}=8$, respectively. Panel C The region of oscillations is determined by $\gamma_{\text{prolTrans}}$ and the ratio between the size of $T_{2\text{Pit}}$ and $T_{1\text{Pit}}$. For increasing values of $T_{20\text{Pit}} / T_{10\text{Pit}}$, the stability threshold is shifted towards smaller $\gamma_{\text{prolTrans}}$ values. Panel D Region of oscillations determined by $\gamma_{\text{prolTrans}}$ and MTT_{Pit} values.
